

# Examples

Example scripts for various things you can do with KubeJS

- [FTB Quests Integration](#)
- [Reflection / Java access](#)
- [Painter API](#)
- [Units](#)
- [Network Packets](#)
- [Starting Items](#)
- [FTB Utilities Rank Promotions](#)
- [Clearlag 1.12](#)
- [Scheduled Server Events](#)
- [Running Commands](#)
- [Spawning Entities](#)

# FTB Quests Integration

```
onEvent('ftbquests.custom_task.75381f79', event => {
  log.info('Custom task!')
  event.checkTimer = 20
  event.check = (task, player) => {
    if (player.world.daytime && player.world.raining) {
      task.progress++
    }
  }
})

onEvent('ftbquests.custom_reward.e4f76908', event => {
  log.info('Custom reward!')
  event.player.tell('Hello!')
})

// specific object completion
onEvent('ftbquests.completed.d4f36905', event => {
  if (event.player) {
    event.notifiedPlayers.tell(Text.of(`${event.player.name} completed...
something!`).green())
  }
})

// generic 'quest' object completion. Note: There isnt actually a way to get reliable title on
server side, so dont use event.object.title
onEvent('ftbquests.completed', event => {
  if (event.player && event.object.objectType.id === 'quest') {
    event.notifiedPlayers.tell(Text.of(`${event.player.name} completed a quest!`).blue())
  }
})

// object with tag 'ding' completion
onEvent('ftbquests.completed.ding', event => {
  event.onlineMembers.playSound('entity.experience_orb.pickup')
})
```

```
onEvent('entity.death', event => {  
    if(event.server  
        && event.source.actual  
        && event.source.actual.player  
        && event.source.actual.mainHandItem.id === 'minecraft:wooden_sword'  
        && event.entity.type === 'minecraft:zombie') {  
        event.source.actual.data.ftbquests.addProgress('12345678', 1)  
    }  
})
```

# Reflection / Java access

Very limited reflection is possible, but is not recommended. Use it in cases when KubeJS doesn't support something.

In 1.18.2+ internal Minecraft classes are remapped to MojangMaps at runtime, so you don't have to use obfuscated names if accessing internal Minecraft fields and methods.

An example of adding a block with a custom material, built using reflection to get the MaterialJS class, then make a new instance of that with amethyst sounds and material properties from internal Minecraft classes.

```
// Startup script, 1.18.2
const MaterialJS = java("dev.latvian.mods.kubejs.block.MaterialJS")
const Material = java('net.minecraft.world.level.material.Material')
const SoundType = java('net.minecraft.world.level.block.SoundType')

amethystMaterial = new MaterialJS('amethyst', Material.AMETHYST, SoundType.AMETHYST) //
f_164531_ and f_154654_ are the respective obfuscated names of these fields, for older
versions

//This builder uses 1.18.2 syntax, it will not work in 1.16 or 1.18.1
onEvent('block.registry', event => {
  event.create('amethyst_slab', 'slab')
  material(amethystMaterial) // Use the new MaterialJS instance we created as the material
  tagBlock('minecraft:crystal_sound_blocks')
  tagBlock('minecraft:mineable/pickaxe')
  requiresTool(true)
  texture('texture', 'minecraft:block/amethyst_block')
})
```

This does come at a cost, it takes 1-2 seconds to load this script, instead of the normal milliseconds. You should import your classes at the top of the script, instead of in an event, especially if the event gets triggered more than once.

# Painter API

## About

Painter API allows you to draw things on the screen, both from server and directly from client. This can allow you to create widgets from server side or effects on screen or in world from client side.

Currently it doesn't support any input, but in future, in-game menus or even GUIs similar to Source engine ones will be supported.

Paintable objects are created from NBT/Json objects and all have an id. If id isn't provided, a random one will be generated. Objects x and z are absolute positions based on screen, but you can align elements in one of the corners of screen. You can bulk add multiple objects in one json object. All properties are optional, but obviously some you should almost always override like size and position for rectangles.

`paint({...})` is based on upsert principle - if object doesn't exist it will create it (if the object also contains valid `type`), otherwise, update existing:

- `event.player.paint({example: {type: 'rectangle', x: 10, y: 10, w: 20, h: 20}})` - New rectangle is created
- `event.player.paint({example: {x: 50}})` - Updates previous rectangle with partial data

You can bulk update/create multiple things in same object:

- `event.player.paint({a: {x: 10}, b: {x: 30}, c: {type: 'rectangle', x: 10}})`

You can remove object with `remove: true`, bulk remove multiple objects or remove all objects:

- `event.player.paint({a: {remove: true}})`
- `event.player.paint({a: {remove: true}, b: {remove: true}})`
- `event.player.paint({'*': {remove: true}})`

These methods have command alternatives:

- `/kubejs painter @p {example: {type: 'rectangle', x: 10, y: 10, w: 20, h: 20}}`

If the object is re-occurring, it's recommended to create objects at login with all of its static properties and `visible: false`, then update it later to unhide it. Painter objects will be cleared when players leave world/server, if its persistent, then it must be re-added at login every time.

## Currently available objects

Underlined objects are not something you can create

## Root

(available for all objects)

- Boolean visible
- Float x
- Float y
- Float z
- Float w
- Float h
- Enum alignX (one of 'left', 'center', 'right')
- Enum alignY (one of 'top', 'center', 'bottom')
- Enum draw (one of 'ingame', 'gui', 'always')
- Float moveX
- Float moveY
- Float expandW
- Float expandH

## rectangle

- Color color
- String texture
- Float u0
- Float v0
- Float u1
- Float v1

## gradient

- Color color
- Color colorT
- Color colorB
- Color colorL
- Color colorR
- Color colorTL
- Color colorTR
- Color colorBL
- Color colorBR
- String texture
- Float u0
- Float v0
- Float u1
- Float v1

## text

- Text text | Text[] textLines
- Boolean shadow
- Float scale
- Color color
- Boolean centered
- Float lineSpacing

## item

- ItemStack item (supports either 'itemid' or vanilla {id: 'item', Count: 4, tag: {...}} NBT syntax)
- Boolean overlay
- String customText
- Float rotation

## Properties

- Unit is a [Rhino Unit](#). It can be a number, boolean, color, equation. Every Float, Int, Boolean and Color are also Units, so you can use equations on them.
- Int is a int32 number, any whole value, e.g. `40`.
- Float is float64 floating point number, e.g. `2.35`.
- String is a string, e.g. `'example'`. Textures usually need resource location `'namespace: path/to/texture.png'`.
- Color can be either `0xRRGGBB`, `'#RRGGBB'`, `'#AARRGGBB'`, e.g. `'#58AD5B'` or chat colors `'red'`, `'dark_aqua'`, etc. RGBA `color(Float, Float, Float, Float)` is also supported where Float is any number between 0.0 and 1.0 (supports Units).
- Text can be a string `'Example'` or `Text.of('Red and italic string example').red().italic()` etc formatted string.

## Available Unit variables

- `$screenW` - Screen width
- `$screenH` - Screen height
- `$delta` - Render delta
- `$mouseX` - Mouse X position
- `$mouseY` - Mouse Y position

## Available Unit constants

- `true` - boolean true value, equal to 1.0
- `false` - boolean false value, equal to 0.0
- `PI` - number equal to 3.14159265358979323846
- `HALF_PI` - number equal to 1.57079632679
- `TWO_PI` - number equal to 6.28318530718

- E - number equal to 2.7182818284590452354

## Examples

```
onEvent('player.logged_in', event => {
  event.player.paint({
    example_rectangle: {
      type: 'rectangle',
      x: 10,
      y: 10,
      w: 50,
      h: 20,
      color: '#00FF00',
      draw: 'always'
    },
    last_message: {
      type: 'text',
      text: 'No last message',
      scale: 1.5,
      x: -4,
      y: -4,
      alignX: 'right',
      alignY: 'bottom',
      draw: 'always'
    }
  })
})

onEvent('player.chat', event => {
  // Updates example_rectangle x value and last_message text value to last message + contents
  from event
  event.player.paint({example_rectangle: {x: '(sin((time() * 1.1)) * (($screenW - 32) / 2))', w:
  32, h: 32, alignX: 'center', texture: 'kubejs:textures/item/diamond_ore.png'}})
  event.player.paint({last_message: {text: `Last message: ${event.message}`}})
  // Bulk update, this is the same code as 2 lines above, you can use whichever you like better
  // event.player.paint({example_rectangle: {x: 120}, last_message: {text: `Last message:
  ${event.message}`}})
  event.player.paint({lava: {type: 'atlas_texture', texture: 'minecraft:block/lava_flow'}})
})
```

Image not found or type unknown

# Units

This page describes all functions and operations available for units

## Usage

Most basic unit is plain number, such as `'1'` or `'4.5'`.

You can use variables with `$` like `'$example'`.

Each function requires name parenthesis and comma separated arguments e.g. `'min(PI, $example)'`.

You can combine as many as you want, e.g. `'min(PI, 10 + $example)'`.

You can do pretty complex infix, e.g. `'atan2($mouseY, $mouseX) - HALF_PI - HALF_PI / 2'`.

## Constants

- `true` - boolean true value, equal to 1.0
- `false` - boolean false value, equal to 0.0
- `PI` - number equal to 3.14159265358979323846
- `HALF_PI` - number equal to 1.57079632679
- `TWO_PI` - number equal to 6.28318530718
- `E` - number equal to 2.7182818284590452354

## Operations

- `cond ? a : b` = TERNARY, if cond then a, else b
- `-a` = NEGATE
- `a + b` = SUM
- `a - b` = SUB
- `a * b` = MUL
- `a / b` = DIV
- `a % b` = MOD
- `a ** b` = POW
- `a & b` = BIT AND
- `a | b` = BIT OR
- `a ^ b` = BIT/BOOL XOR
- `~a` = BIT NOT
- `!a` = BOOL NOT
- `a << b` = SHIFT LEFT
- `a >> b` = SHIFT RIGHT

- `a == b` = EQUALS
- `a != b` = NOT EQUALS
- `a > b` = GREATER THAN
- `a < b` = LESS THAN
- `a >= b` = GREATER OR EQUAL THAN
- `a <= b` = LESS OR EQUAL THAN

## Functions

- `random()`
- `time()`
- `roundTime()`
- `min(a, b)`
- `max(a, b)`
- `pow(a, b)`
- `abs(a)`
- `sin(a)`
- `cos(a)`
- `tan(a)`
- `atan(a)`
- `atan2(y, x)`
- `deg(a)`
- `rad(a)`
- `log(a)`
- `log10(a)`
- `log1p(a)`
- `sqrt(a)`
- `sq(a)`
- `floor(a)`
- `ceil(a)`
- `if(statement, trueUnit, falseUnit)`

# Network Packets

This script shows how to use network packets:

```
// Listen to a player event, in this case item right-click
// This goes in either server or client script, depending on which side you want to send the
data packet to
onEvent('item.right_click', event => {
    // Check if item was right-clicked on client or server side
    if (event.server) {
        // Send data {test: 123} to channel "test_channel_1". Channel ID can be any string, but
it's recommended to keep it to snake_case [a-z_0-9].
        // Receiving side will be client (because its sent from server).
        event.player.sendData('test_channel_1', { test: 123 })
    } else {
        // It's not required to use a different channel ID, but it's recommended.
        // Receiving side will be server (because its sent from client).
        event.player.sendData('test_channel_2', { test: 456 })
    }
})

// Listen to event that gets fired when network packet is received from server.
// This goes in a client script
onEvent('player.data_from_server.test_channel_1', event => {
    log.info(event.data.test) // Prints 123
})

// Listen to event that gets fired when network packet is received from client.
// This goes in a server script
onEvent('player.data_from_client.test_channel_2', event => {
    log.info(event.data.test) // Prints 456
})
```

# Starting Items

This server script adds items on first time player joins, checking stages. GameStages mod is not required

```
// Listen to player login event
onEvent('player.logged_in', event => {
  // Check if player doesn't have "starting_items" stage yet
  if (!event.player.stages.has('starting_items')) {
    // Add the stage
    event.player.stages.add('starting_items')
    // Give some items to player
    event.player.give('minecraft:stone_sword')
    event.player.give(Item.of('minecraft:stone_pickaxe', "{Damage: 10}"))
    event.player.give('30x minecraft:apple')
  }
})
```

# FTB Utilities Rank Promotions

With this script you can have FTB Utilities roles that change over time.

Is for 1.12 only. Requires FTB Utilities.

```
events.listen('player.tick', function (event) {
    // This check happens every 20 ticks, a.k.a every second
    if (event.player.server && event.player.ticksExisted % 20 === 0) {
        var rank = event.player.data.ftbutilities.rank
        events.post('test_event', {testValue: rank.id})
        var newRank = ftbutilities.getRank(rank.getPermission('promotion.next'))

        if (newRank) {
            var timePlayed = event.player.stats.get('stat.playOneMinute') / 20 // Seconds player has
            been on server
            var timeRequired = newRank.getPermissionValue('promotion.timer').getInt()

            if (timeRequired > 0 && timePlayed >= timeRequired && rank.addParent(newRank)) {
                if (!events.postCancelable('ftbutilities.rank.promoted.' + newRank.id, {'player':
event.player, 'rank': newRank})) {
                    event.player.tell('You have been promoted to ' +
newRank.getPermission('promotion.name') + '!!')
                }
                ftbutilities.saveRanks()
            }
        }
    }
})

// When player gets promoted to 'trusted' rank, give them gold ingot (uncomment the line)
events.listen('ftbutilities.rank.promoted.trusted', function (event) {
    // event.data.player.give('minecraft:gold_ingot')
})
```

3 example roles in ranks.txt:

```
[player]
power: 1
default_player_rank: true
promotion.name: Player
promotion.next: newcomer
promotion.timer: 5
command.ftbutilities.rtp: false
command.ftbutilities.home: false

[newcomer]
power: 5
promotion.name: Newcomer
promotion.next: regular
promotion.timer: 15
ftbutilities.chat.name_format: <&aNewcomer &r{name}>
command.ftbutilities.rtp: true

[regular]
power: 10
promotion.name: Regular
promotion.next: trusted
promotion.timer: 30
ftbutilities.chat.name_format: <&9Regular &r{name}>
command.ftbutilities.home: true
```

After 5 seconds of play time, player will be promoted to newcomer.

After 15 seconds (or 10 since previous role) they will be promoted to regular.

After 30 seconds (or 15 since previous role) they will be promoted to trusted, etc.

# Clearlag 1.12

This script removes all items from world every 30 minutes. Only works in 1.12.

```
// Create item whitelist filter that won't be deleted with clearlag
var whitelist = Ingredient.matchAny([
    'minecraft:diamond', // Adds diamond to whitelist
    'minecraft:gold_ingot',
    '@tinkersconstruct', // Adds all items from tinkersconstruct to whitelist
    'minecraft:emerald'
])

// Create variable for last clearlag result
var lastClearLagResult = Uteis.newList()
// Create variable for total number of items
var lastTotalClearLagResult = Uteis.newCountingMap()

// Create new function that clears lag
var clearLag = server => {
    // Get a list of all entities on server with filter that only returns items
    var itemList = server.getEntities('@e[type=item]')
    // Create new local map for item counters
    var lastResult = Uteis.newCountingMap()
    // Clear old result lists
    lastClearLagResult.clear()
    lastTotalClearLagResult.clear()
    // Iterate over each entity in itemList and add item counters
    itemList.forEach(entity => {
        if (!whitelist.test(entity.item)) {
            // Get the name of item
            var key = entity.item.name
            // Add to entity count
            lastResult.add(key, 1)
            // Add to total item count
            lastTotalClearLagResult.add(key, entity.item.count)
            // Kill the item entity
            entity.kill()
        }
    })
}
```

```

    }
  })

  // Update and sort last result list
  lastClearLagResult.addAll(lastResult.entries)
  lastClearLagResult.sort(null)

  // Tell everyone how many items will be removed
  server.tell([
    Text.lightPurple('[ClearLag]'),
    ' Removed ',
    lastTotalClearLagResult.totalCount,
    ' items. ',
    Text.yellow('Click here').click('command: /clearlagresults'),
    ' for results.'
  ])
}

// Listen for server load event
events.listen('server.load', event => {
  // Log message in console
  event.server.tell([ Text.lightPurple('[ClearLag]'), ' Timer started, clearing lag in 30
minutes!' ])
  // Schedule new task in 30 minutes
  event.server.schedule(MINUTE * 30, event.server, callback => {
    // Tell everyone on server that items will be removed
    callback.data.tell([ Text.lightPurple('[ClearLag]'), ' Removing all items on ground in one
minute!' ])
    // Schedule a subtask that will clear items in one minute
    callback.data.schedule(MINUTE, callback.data, callback2 => {
      clearLag(callback2.data)
    })
    // Re-schedule this task for another 30 minutes (endless loop)
    callback.reschedule()
  })
})

// Doesnt work in 1.16+!
// Register commands
events.listen('command.registry', event => {

```

```

// Register new OP command /clearlag, that instantly runs clearlag
event
    .create('clearlag')
    .op()
    .execute(function (sender, args) {
        clearLag(sender.server)
    })
    .add()

// Register new non-OP command /clearlagresults, that displays stats of all removed items
from previous /clearlag
event
    .create('clearlagresults')
    .execute((sender, args) => {
        sender.tell([ Text.lightPurple('[ClearLag]'), ' Last clearlag results:' ])

        lastClearLagResult.forEach(entry => {
            var total = lastTotalClearLagResult.get(entry.key)

            if (entry.value == total) {
                sender.tell([ Text.gold(entry.key), ': ', Text.red(entry.value) ])
            } else {
                sender.tell([ Text.gold(entry.key), ': ', Text.red(entry.value), ' entities, ',
Text.red(total), ' total' ])
            }
        })
    })
    .add()
})

```

# Scheduled Server Events

At server load, you can schedule anything to happen at later time. Within callback handler you can also call `callback.reschedule()` to repeat this event after initial timer or `callback.reschedule(newTime)` to change it.

Whatever you pass as 2nd argument will be returned in callback as `data`.

The example script restarts server after 2 hours but notifies players 5 minutes before that.

```
onEvent('server.load', function (event) {
    event.server.schedule(115 * MINUTE, event.server, function (callback) {
        callback.data.tell('Server restarting in 5 minutes!')
    })

    event.server.schedule(120 * MINUTE, event.server, function (callback) {
        callback.data.runCommand('/stop')
    })
})
```

# Running Commands

## Preface

Sometimes, you might want to run a command (such as `/tell @a Hi!`), in your code.

Most always, there is better method, but sometimes, you just don't want to learn more complicated topics, and just run a command.

## Basic Usage

The most basic usage would be to call `runCommand()` from a `server` class.

```
Utils.server.runCommand(`tell @a Hi!`)
```

If this command returns a message (usually an error) that is normally placed chat, it will be logged. This is not desired outside of debugging situations.

So instead you can use the following to not log these messages.

```
Utils.server.runCommandSilent(`tell @a Hi!`)
```

If the server is not loaded at the time this is ran, then the code will not work.

Although you can use `player.runCommandSilent()`, it is not recommend as the command runs with the players permission level.

## Using the execute command

Commands are ran in the default dimension (the overworld usually) at 0, 0, 0

To get around this, you can use the execute command:

```
//This example makes a bedrock box around creepers when they spawn
onEvent('entity.spawned', event => {
  if (event.entity.type !== "minecraft:creeper") return // the following code only runs when
  creepers are spawned
```

```
event.server.runCommandSilent(`execute in ${event.entity.level.dimension} positioned  
${event.entity.x} ${event.entity.y} ${event.entity.z} run fill ~-1 ~-1 ~-1 ~1 ~2 ~1 bedrock  
hollow`)  
})
```

# Spawning Entities

## Basics

### Overview

Spawning entities consists of 3 steps:

- Making the variable storing the future entity
- Modifying the attributes of the entity
- Spawning the entity

### Making a variable to store the entity

#### Example

**level** is just a placeholder, in your code it needs to be defined, for many events you can use `event.level` in place of `level` and it will work

You can create a entity from a **block** instead of **level**, and this is often preferred to learn that, scroll to that section afterward

```
let myEntity = level.createEntity("cow")
```

### Breaking down the example

- **let**
  - Indicate that we are making a new variable and get the game ready to store it.
  - Not required in 1.16.
- **myEntity**
  - This is the name of the variable.
  - Can be anything you chose that is a-Z,0-9 without spaces (you know like any other variable).
- **=**
  - sets **myEntity** to what is about to follow.
- **level**
  - This is any level object that you choose.
  - This can be obtained numerous ways and will depend on what you are trying to do.

- In many events you can use `event.level` to get the level.
- Note: this is a `LevelJS` object, not a `MinecraftLevel` object.
  - `minecraftLevel.asKJS()` returns a `LevelJS`.
- .
  - The dot operator either
    - Gets a property of the object.
    - Calls a method of the object.
    - Calls a beamed method of the object.
  - In this case it is used to call the method `createEntity`. You can tell because the following parenthesis mean its a method.
- **createEntity(...)**
  - As mentioned above is the method called by the dot operator
- **"cow"**
  - this is the name of the entity
  - "minecraft:cow" or "create:potato\_projectile" are also valid
    - in fact when you put a *resource location* without a prefix, then `minecraft:` will be assumed.

## Modifying the properties

### Example

```
myEntity.x = 0
myEntity.y = 69
myEntity.z = 0
myEntity.motionY = 0.1
myEntity.noGravity = true
```

### Breaking Down the Example

- **myEntity**
  - Gets the variable that was made earlier.
- .
  - The dot operator mentioned earlier.
- **motionY = 0.1**
  - Instead of being a method, like last time, this is a beamed method.
  - This means that there exists a method `setMotion` and under the hood it runs `setMotionY(0.1)` that is automatically called with this code.
  - In this case it sets the `motionY` property of the entity.
- You many not change arbitrary bits of NBT this way! Only bits that there is a method for. In the example, all of the lines are just running beamed methods. However, you can do it with a different method, listed in a different section below.

# Spawning the entity

## Example

```
myEntity.spawn()
```

With understanding from the previous sections you should be able to figure out what this does.

It get **myEntity**, then calls the method **.spawn()**.

This `spawn()` method creates the entity in the world.

Note: myEntity is still a variable! So you may not use `let myEntity` again within the scope! However this variable is still linked to the entity so calling `myEntity.motionY = 0.1` will still set the vertical motion of the entity. (This can be a useful thing, but bad if you are unaware)

## Creating the entity from a block

You can also call `createEntity` from a block! This is handy if you want to spawn the entity in the position of a block.

```
let myEntity = block.createEntity("cow")
```

Again, **block** is just a place holder, you will need to change it to something else like maybe `event.block` for your code to work!

This does **not** spawn the entity in the center of the block, it just sets the entity's coordinates to that of the block, thus being misaligned

This code offsets the entity to be in the center of the block.

```
let myEntity = block.createEntity("cow")
myEntity.x+=0.5
myEntity.y+=0.5
myEntity.z+=0.5
```

## Setting NBT

You **can** set the NBT to whatever you want! It's recommend using `mergeFullNBT` to do this.

```
myEntity.withNBT({VillagerData: {}})
```

`myEntity.fullNBT.VillagerData = {}` will not work, because **.fullNBT** is a beaned method, not a property! The only thing that the beaned method lets do is to be able to use `let nbt = myEntity.fullNBT` to set a variable to NBT to be read or use `myEntity.fullNBT = {}` to set all of it at once.

Note it is **fullNBT** not **nbt**, because kubejs uses `nbt` for a different purpose. A bit confusing, but it is what it is.

## Item Entities

There are two ways to create item entities in KubeJS.

### popItem

If you want to easily create the item from a certain block then you can use the `popItem` method.

### Example

```
block.popItem('minecraft:diamond')
```

The item can be an `Item.of()` instead if you wish

### createEntity("item")

Creating an item entity with a little more control be done identically to any other entity, except you get a couple more methods.

### Example

```
let itemEntity = block.createEntity("item")
itemEntity.y+=0.8
itemEntity.x+=0.5
itemEntity.z+=0.5
itemEntity.item = Item.of("enchanted_book").enchant("thorns", 2)
itemEntity.item.count = 1
itemEntity.pickupDelay = 600
itemEntity.noGravity = true
itemEntity.motionY = 0.08
```

```
itemEntity.spawn()
```

In this example

- the **.item** beaned method is used to set the item of the item stack **(Required)**
- the **.pickupDelay** beaned method is used to set the pickup delay (Optional)

## Examples

Spawns an endermite when braking dirt with a 5% chance

```
onEvent("block.break", event => {  
  if (event.block.id != "minecraft:dirt" || Math.random() > 0.05) return  
  //only if its dirt and only has 5% chance  
  let myEndermite = event.block.createEntity("endermite")  
  myEndermite.x += 0.5  
  myEndermite.y += 0.5  
  myEndermite.z += 0.5  
  myEndermite.spawn()  
})
```

Turns gravel to sand and drops clay when right clicked with flint

```
onEvent('block.right_click', event => {  
  if (event.block.id == 'minecraft:gravel' && event.item.id == 'minecraft:flint') {  
    event.block.set('sand')  
    event.item.count--  
    event.block.popItem('clay')  
  }  
})
```

Overrides enchanting table behavior when clicking on it with an item in you hand. Instead will make the item float up a while, then fall back down.

```
onEvent('block.right_click', event => {  
  if (event.block.id != 'minecraft:enchanting_table') return  
  if (event.item.count == 0) return  
  event.cancel()  
  let item = event.item.copy()  
  //if did not use .copy() the item would still be referencing the one in the hand, so  
  setting the count to 1 would set the count in the hand to 1
```

```

    item.count = 1
    event.item.count--
}

let itemEntity = event.block.createEntity('item')
itemEntity.y+=0.8 // on the top of the encahnting table, not in it
itemEntity.x+=0.5
itemEntity.z+=0.5
itemEntity.item = item
itemEntity.item.count = 1
itemEntity.pickupDelay = 100
itemEntity.noGravity = true
itemEntity.motionY = 0.08
itemEntity.spawn()

function callback (i) {
    //changes the scope of itemEntity (otherwise if used 2 times in a row within 5 seconds,
problems would occur)
    event.server.scheduleInTicks(100, callback => { // this code runs 5 seconds later
        i.noGravity = false
    })
}

callback(itemEntity)
})

```
