String

> Class of string objects, such as "abc" (and in JS 'abc' works as well)

Parent

Object

Variables and Functions

Name	Type	Info
empty	boolean	Returns if string is empty a.k.a `string === ''`
toLowerCase()	String	Returns a copy of this string, but with all characters in upper case
toUpperCase()	String	Returns a copy of this string, but with all characters in lower case
equalsIgnoseCase(String other)	boolean	Hash code of this object. It is used to optimize maps and other things, should never be used for object equality.
length()	int	Number of characters
charAt(int index)	char	Single character at index
