

String

Class of string objects, such as "abc" (and in JS 'abc' works as well)

Parent

[Object](#)

Variables and Functions

Name	Type	Info
<code>empty</code>	boolean	Returns if string is empty a.k.a <code>string == ""</code>
<code>toLowerCase()</code>	String	Returns a copy of this string, but with all characters in upper case
<code>toUpperCase()</code>	String	Returns a copy of this string, but with all characters in lower case
<code>equalsIgnoreCase(String other)</code>	boolean	Hash code of this object. It is used to optimize maps and other things, should never be used for object equality.
<code>length()</code>	int	Number of characters
<code>charAt(int index)</code>	char	Single character at index
